

Project 4 : Agentic AI

Corporate Incubation Agents (CIA)

Contents / Agenda

Executive Summary

Section 1 – Problem and the opportunity

Section 2 – Design the Agentic AI System

Section 3 – Identify Risks and Design Governance

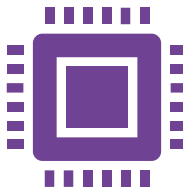

Section 4 – Roadmap and Business Case

Appendix

Executive Summary

A large company A has a need to align with the times and strategically decided to allocate budget around incubating startups 2 years ago. But, business Units cannot find the right startups to solve the “Build Vs Buy” problem which has had led to missed market opportunities and stagnant growth.

The Corporate Incubation Agents (CIA) addresses these inefficiencies of corporate innovation in company A as It aligns with an

Agile mindset as startups which needs incubation generally face a lot of hurdles due to slow procurement, budget allocation, legal & compliance adherence criteria and finally Internal alignment among teams to create a fast-paced ecosystem.

Section 1 – Problem and the opportunity

1

2

3

4

Problem

Company A historically has had a complex inorganic growth over the years and does see its struggles to integrate external innovation. Startups generally operate at a very fast velocity and fail to get on-boarded during enterprise onboarding process. Also, few Business units go through Analysis Paralysis where they cannot lock in on the right startup to solve their specific “Build versus Buy” problem which leads to missed opportunities.

Current Pre Defined Process

- 1) Sourcing of Innovation Teams to manually review & scout with LinkedIn/other platforms
- 2) Vetting & intensive reviews of Innovation Pitch Slide Decks and technical capabilities
- 3) Alignment where Business Unit Stakeholder requirements and budget needs to match
- 4) Onboarding Matrix where Procurement, Legal, Security & Technology reviews happen.
- 5) Result where a very small percentage of startups pass as the right fit which results in a high volume of potential leads moving to competitors

Pain Area Quantification

- 1) Time to Pilot – Circa 9-10 months
- 2) Success Rate – Less than 10% of the selected startups reach Proof of Concept
- 3) Opportunity Cost – Budget funding to ROI being minimal and millions lost.

Agentic AI Approach

A potential opportunity is seen for an agent to scavenge the startup ecosystem data, act as a potential scout by querying internal project roadmaps & 3 year strategy among Business Units, and finally loop between Compliance and Security to ensure the right selection.

Section 2- Design the Agentic AI System

Code Name of Agent- CIA (Corporate Incubation Agent) Suite

Role – The scout matches external startup capabilities with Matchmaker Agent catering to Internal BU Pain areas & mid term strategy maintaining initial anonymity

Decisions – Validation for which startups are the best potential fit based on a score index criteria and determines whether Google/Azure or AWS are appropriate for the sandbox environment to start upon.

Tools and Data Sources

- **External Intelligence Metric** – Pitchbook, Github or Crunchbase API
- **Internal Intelligence** – Strategy Documents, Sharepoint, Confluence Pages, JIRA Product Roadmaps & Budget Documents.
- **Generative Engine** – GitHub Co-Pilot. Hugging face API. Developer portals to customize Business Case Writeups for Senior Leaders/VP's for Business Units.

ReACT Loop (Reason & Act)

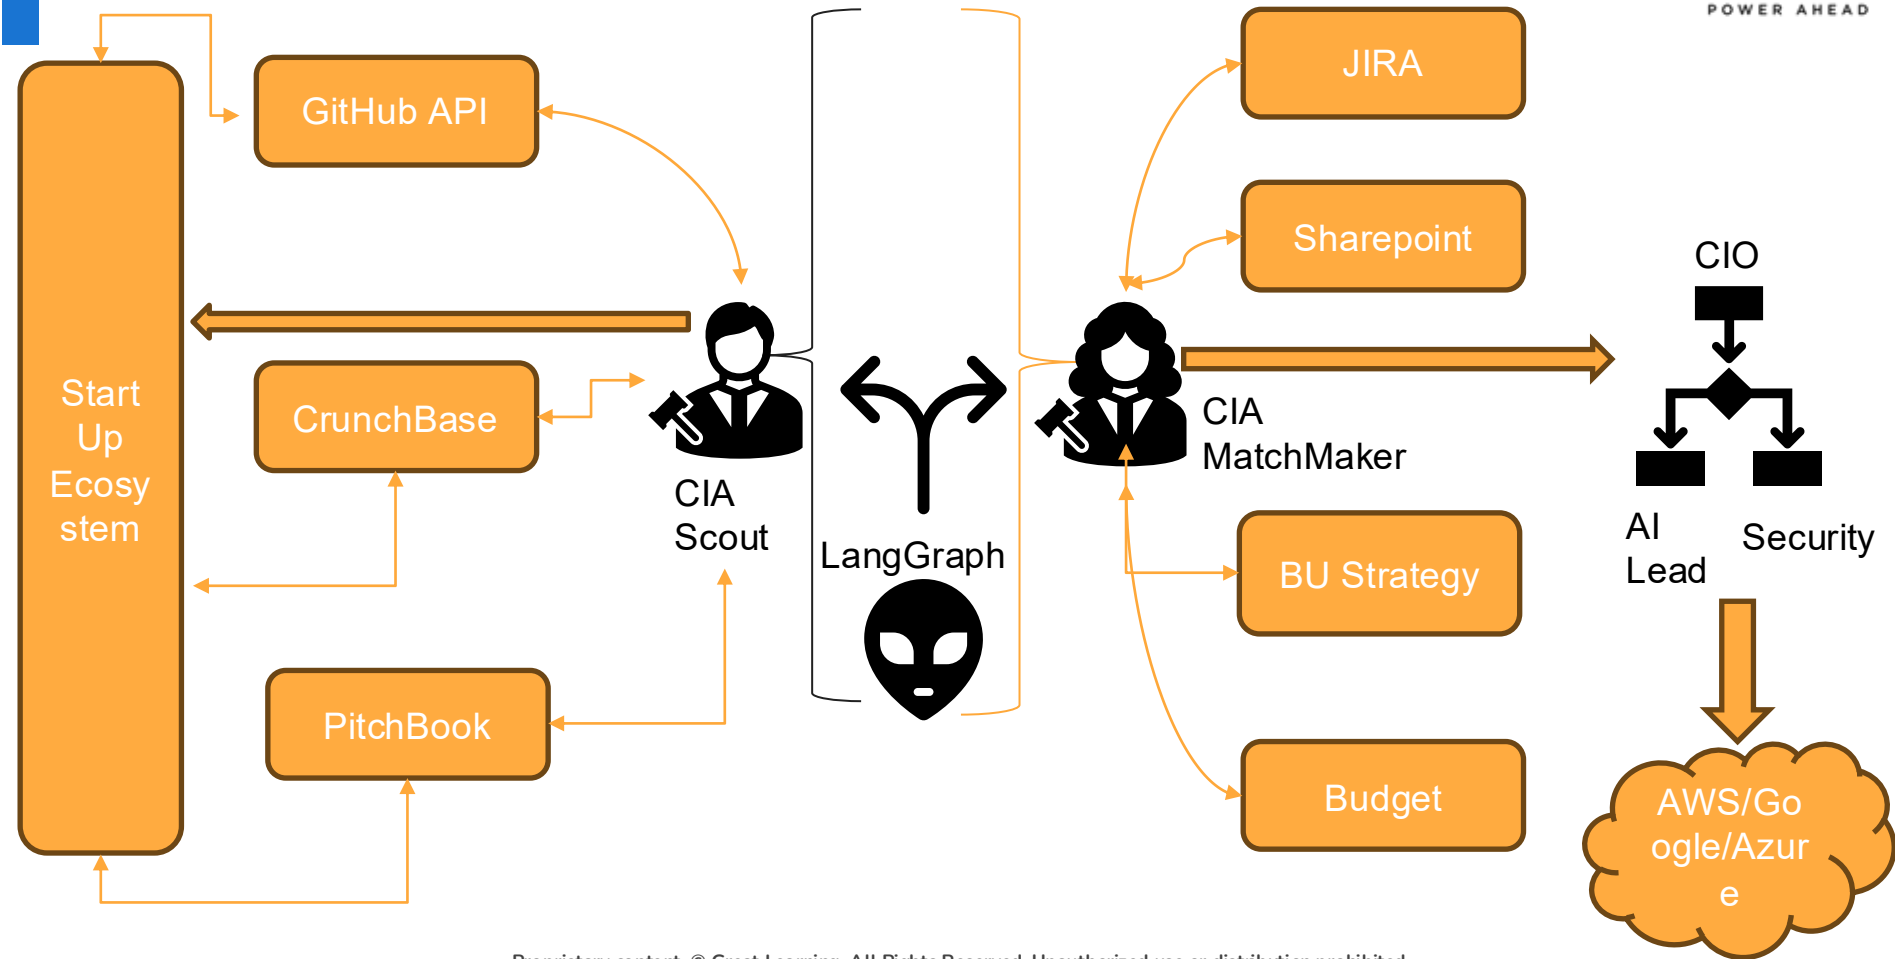

- **Reason (Internal Match Maker Agent)**– Most of the BU's Infrastructure model has a higher cost which is 20% greater than target for year on year for savings. There is a need for a partner with Sparse Memory management. The internal Agent needs to solve this priority Top 3 problem in JIRA which results in cost spillage.
- **Act (Internal Agent – External Scout)**– Task the External Scout to find seed stage Startups which specializes in Builds for Kernels with “sparse attention”
- **Act (External Scout)**– Triggers the GitHub API to search for high starred new repos tagged with “Sparse attention” and in parallel references CrunchBase for newly funded infrastructure teams. There is a match called “Orange Tech”.
- **Observe (External Scout)** – Finds Sparse AI which reduces VRAM by 40% while maintaining 99% accuracy.
- **Respond (Internal Matchmaker)**– This is a High strategic match. A limited NDA is being set up in “Sandbox” LLM environment for initial 3-week Data Trial.

Memory Design

- **Short Term** - Tracks active results on latency for Clusters and reports on Technical Trials.
- **Long Term Memory** –
 - Earlier Partners had flagged that optimization caused loss in financial queries flagging as Risk
 - Orange Tech uses a specific Windows Only Native stack so Linux flavour optimization is out of scope.

CIA (Corporate Incubation Agent) Architecture

Section 3 – Identify Risks and Design Governance

Risks –

- **Biasness of Selection** – CIA may select “hyped” and index them as front runners while ignoring foundational innovations in hardware or sustainability.
- **Compliance Bypass**- There may be shortcuts explored in the name of autonomous agent, but it’s a critical security check to avoid speed up in Pilot phase.
- **IP Leakage & Cookies** - The agent may accidentally share proprietary roadmaps or critical strategy information while in matching phases. Anonymity is key.

Human in the Loop Checkpoint –

- **CIO Gate** - For every CIA agent here invariably would exist a CIO (Chief Innovation Officer) who needs to digitally sign before this enters ecosystem of Company A and gets system Access.
- **Data Mask** – While CIA sends internal “problems” to the potential startup, it must use some generics based on LLM to maintain anonymity to remove all sensitive company identifiers.
- **Legal Review** – All agent generated NDA, contracts or legal documents need to pass a Corporate Procurement Officer for Legal Sanity checks.

Guardrails Among Agents –

- **Role Based Access Control (RBAC) for Agents** –A “Need to know” Silo where the External facing CIA Scout Agent scans through API’s like Crunchbase, LinkedIn but has anonymized all the internal strategy statements with Matchmaker and has zero access to any project details, budgets or IPs. It “Must not” be able to interact with the Google/AWS/Azure environment.
- **CIA Matchmaker** – Full Access to Internal Strategy Documents and JIRA and capable of performing High Level Reasoning. Example of Agent-to-Agent Interaction - “Find a startup that does ABC” instead of ever saying “Find a Startup which does Project Edita”. One way rule is established between External scouting agent for information handover to Internal Matchmaker Agent so that data isn’t leaked out. Communication through LangGraph as per DevOPS protocols

Section 4 – Roadmap & Business Case

Roadmap in Phases –

- **Phase 1** – For First three weeks the Internal Corporate Incubation Agent establishes the foundations where it connects to JIRA portals and Strategy documents while the External Scout agents keeps monitoring GitHub, LinkedIn, Crunchbase. Goal is to first determine which BU's have the immediate need based on priority.
- **Phase 2** – Would be from 3rd week onwards to the 6th week where the Focus is on enabling the ReACT loop among the two agents. Agentic Handshake is needed as the Internal agent identifies the priority gaps and sends a milestone date to the External Agent. As this response is received, it is determined to be a key milestone as it removes the screen time needed by humans by 80-90%.
- **Phase 3** – The Focus around 6th week onwards to 12th week is now on incubation where a clear milestone is around the creation of Google/Azure/AWS sandbox once the digital signatures are acquired by CIO. This will also trigger the NDA and communication in collaboration with the PO's which ensures that onboarding is complete.

Business Case –

- **Investment** – API access to venture database and around 3 months of time for internal AI development.
- **Return of Investment** – The Time to scope and Time to Pilot is reduced by 60% from 9+ months to 3 months(12 weeks) which now taps into quarter-to-quarter releases of emerging startups which crop during various quarters. Also, 7-10 FTE involvement from Internal pools is reduced to 2 FTE (AI, Security) & Approvers (CIO & PO).

Outcome-

Startup environments now view Company A as moving in a Frictionless Innovation mode where CIA agents has removed bureaucracy. Additionally, Company A now is a partner of Choice for many Innovative Startups and a large velocity is sustained. Company A has now quickly successfully transitioned from a "Slow-moving Giant" to an "Active Innovation Hub" attracting the world's best startups as CIA agents knows exactly what is needed versus exactly where to find it.

APPENDIX

Happy Learning !
